Class rule on the parent, descendant rule on the child (child blue, parent red)

parent child parent

!important border beats a child's inline border only on the same element

parent stays red child inline green

id selector beats class selector for padding

id padding class padding

Child combinator (only direct children) versus descendant combinator (all levels)

parent direct child grandchild not matched

parent direct child grandchild matched

!important text-transform on the parent does not stop a child's own rule

PARENT child lower SAME ELEMENT NONE LOSES

Higher specificity on the parent's rule does not affect the child's own rule

element with both rules child with class only
